

Course Code: NURS 111

Course: FUNDAMENTALS OF NURSING PRACTICE I

Lecture I: **INTRODUCTION TO NURSING AND
PROFESSIONALISM**

Class: BScN Y1S1

DEVOTION

- And the King will answer and say to them, 'Assuredly, I say to you, inasmuch as you did it to one of the least of these My brethren, you did it to Me.
- **Bible Verse:** Matthew 25:40

LEARNING OBJECTIVES

- Define key terms
- Define Nursing as an art and a science
- Discuss major historical and social events that have shaped nursing practice
- Describe Florence Nightingale's impact on current nursing practice

INTRODUCTION

- The word nurse originated from the Latin word *nutrix*, meaning “to nourish.”
- Most definitions of nursing describe the nurse as a person who nourishes, fosters, and protects and who is prepared to take care of sick, injured, and aged people.
- The central focus in all definitions of nursing is the patient (the person receiving care) and includes the physical, emotional, social, and spiritual dimensions of that person.

DEFINITIONS AND CONCEPTS

Definition of “nursing.”

- Nursing is a health care discipline, profession, **and practice**, with and on behalf of individuals, families, and their communities within the context of institutions and systems.
- Nursing lives out its social contract by advancing health and social justice.

Nursing

- **At the individual and family level**, nursing involves the lending of one's strength, will, and knowledge when a person is unable to meet their health needs without assistance or action.
- **In health services**, nursing plays a dominant role in patient safety, service management, and the design and delivery of health systems. **At the broader community, country and global levels** the profession advocates and acts for population health, access and equity, and a safe and sustainable environment.

Nursing

- Nursing encompasses autonomous and collaborative care of individuals of all ages, families, groups, and communities, sick or well, and in all settings.
- Nursing includes the promotion of health, prevention of illness, and care of individuals who are ill, disabled, or dying.
- Advocacy, promotion of a safe environment, research, participation in shaping health policy and in patient and health systems management, and education are also key nursing roles

Nurse

- Definition of a nurse
- A nurse is a health care professional who is EDUCATED in the science, art, and philosophy of the discipline of nursing; is REGULATED to the standards of practice and codes of conduct and ethics of the profession of nursing; and demonstrates evidence-informed, clinical acumen and technical skill in the PRACTICE of nursing.

DEFINITIONS AND CONCEPTS

NURSING

A NURSE

- Educated in the science, art, and philosophy of the **discipline** of nursing
- Regulated to the standards of practice and codes of conduct and ethics of the **profession** of nursing
- Demonstrating evidence-informed, clinical acumen and technical skill in the **practice** of nursing, expressed within a trusted partnership; working independently and collaboratively in promoting health, preventing illness, alleviating suffering, and ensuring patient safety
- They continually improve Nursing's **service** to the public through clinical practice, research, education, management, innovation, advocacy, policy, and leadership

The Nurse

- The nurse is a person who has completed a program of basic, generalized nursing education and is authorized by the appropriate regulatory authority to practice nursing in his/her country.
- Basic nursing education is a **formally recognized program** of study providing a broad and sound foundation in the behavioral, life, and health sciences for the general practice of nursing, for a leadership role, and for specialty or advanced nursing practice.

CONCEPTS RELATED TO THE DEFINITION OF 'A NURSE'

Health professional

- The nurse as a health professional is anchored in formal education and regulation, ensuring accountability, ethical practice, and adherence to professional standards.
- Education in nursing science, art, and philosophy forms the foundation of this concept, supported by regulation to uphold codes of conduct and ethical guidelines.
- Keywords such as 'educated' and 'regulated' capture the professionalism and integrity of nurses.

Concepts Related to the Definition of 'a Nurse'

Roles and responsibilities

- The roles and responsibilities of nurses anchor the definition by emphasizing their critical role in promoting health, preventing illness, alleviating suffering and enhancing health literacy.
- Nurses ensure patient safety through evidence-informed care, trusted partnerships, decision-making, and risk management.
- Keywords such as 'health promotion', 'illness prevention', 'patient safety', 'trusted partnerships', and 'risk management' reflect their comprehensive and collaborative approach to improving health outcomes.

Concepts Related to the Definition of 'a Nurse'

Scope of practice

- The concept of scope of practice anchors the definition by emphasizing the nurse's ability to work to their education, training, competence and lawful authority, in response to an evolving health care environment.

Concepts Related to the Definition of 'a Nurse'

Independent and autonomous practice

- The concepts of independent and autonomous practice anchor nursing's essential role in delivering patient care based on professional judgement, expertise, and evidence-based knowledge.
- Autonomous practice reflects nursing's ability to make independent decisions, manage patient care, and act with accountability within legal and ethical frameworks.

Qualities of a nurse

A nurse should cultivate the following qualities:

- Knowledgeable
- Must be observant
- Accountable and transparent
- A good listener
- Good role model
- Be objective
- Time-conscious
- Neat and pleasant appearance

Qualities of a nurse

- Have sound physical, mental and spiritual health
- Should be courageous
- Lead a well-balanced life
- Be honest and loyal
- Cultivate self-discipline
- Poise: She should be stable and well-balanced
- Should be courteous and understanding
- Should cooperate with other health care personnel to give good care to the patient
- Should be respectful
- Should be gentle and loving

Nursing as an art and a science

- Nursing is an **art** requires expertise and proficiency.
- Deliver care artfully with compassion, caring and respect.
- Nursing is a **science**, requires systemized knowledge derived from observation, critical thinking, study and research

Nursing as an art and a science

- The **art** of nursing can be described as caring, compassion, understanding, communicating, and loving in caring for patients.
- Nursing is an art that requires expertise and proficiency.
- Deliver care artfully with compassion, caring, and respect.
- The **science** of nursing is the pathophysiology, disease process, and techniques learned during nursing education and applied during patient care.
- Nursing is a science that requires systemized knowledge derived from observation, critical thinking, study, and research

CONCEPT OF HEALTH AND DISEASE

Health

- “Health is a state of complete *physical, mental, social, and spiritual well-being* and not merely an absence of disease or infirmity.” (WHO)
- Therefore, health, as a set of qualities, involves the total person

Health

- **Physical health** means that an individual has good complexion, a clean skin, bright eyes, good appetite, sound sleep, regular activity of bowel and bladder, and smooth coordinated bodily movements.
- All the organs of the body function normally.

Health

- **Mental health** means that an individual has the following characteristics:
 - He/she feels comfortable about himself/herself. He/ she neither overestimates nor underestimates his/her own abilities. He/she accepts his/her shortcomings, is internally adjusted, is self-confident, and free from internal conflicts.
 - He/she is at peace with others. He/she can feel part of a group and can get on well with others.
 - A mentally healthy person has good self-control. He/ she is not overcome by emotions, not dominated by fear, anger, love, jealousy, guilt, or worries. He/she faces problems and tries to solve them intelligently.

Health

- **Social health** means ability of making friend ships that are satisfying and lasting, of assuming responsibilities according to one's capabilities, of finding satisfaction, success and happiness in accomplishments of everyday tasks and living happily with others

Health

- **Spiritual health** is an intangible something that transcends physiology and psychology, i.e., the spirit of man.
- A spiritually healthy person maintains faith in religion and believes in empathy and goodness for all.

Disease, Sickness and Illness

- **Disease** is defined as a condition that is diagnosed and identified by a doctor or a medical expert. It is any harmful deviation from the normal structural or functional state of an organism, generally associated with certain signs and symptoms.

Disease is characterized by specific signs and symptoms

Disease, Sickness and Illness

- **Sickness** is defined as the state of being sick or of being affected by an illness, infection, or disease.

Disease, Sickness and Illness

Illness is defined as the ill health the person identifies himself/herself with, often based on self-reported mental or physical symptoms.

- Illness is a fundamental nursing concept that defines a deviation from health with three stages: the onset of illness, the acceptance of the state of illness, and the convalescence or recovery stage.

.

Infirmity

- Physical or mental weakness

CHANGING CONCEPTS OF HEALTH

Biomedical Concept

- Traditionally, health has been viewed as “absence of disease.” If any person is free from disease, he/she is considered healthy.
- This concept is known as the biomedical concept and is based on the Germ Theory of Disease.

Changing Concepts of Health

- **Ecological Concept**

- Ecologists viewed health as a dynamic equilibrium between man and his environment, and disease as a maladjustment of the human beings to the environment.
- Ecological and cultural adaptations determine the occurrence of disease, the availability of food, and the population explosion. This concept supports the need for clean air, safe water, ozone layer in the atmosphere to protect from exposure to unhealthy factors, etc.

Changing Concepts of Health

- **Psychosocial Concept**

- Development in social sciences reveals that disease is both a biological and a social phenomenon.
- There are not only biological factors, but also social, cultural, and psychological factors, which must be taken into consideration while defining health and illness.

Changing Concepts of Health

Holistic Concept

- Holistic concept is the synthesis of biomedical and ecological model and psychosocial concept.
- It recognizes the strength of social, economic, political, and environmental influence on health.
- It has been defined as a unified or multidimensional process involving the well-being of the whole person in the context of his environment.

HEALTH-ILLNESS CONTINUUM

- According to the health-illness continuum, health is a dynamic state that fluctuates as a person adapts to changes in the internal and external environments to maintain a state of total well-being.
- Internal environment refers to physiological system, body temperature, and blood pressure, and external environment refers to atmospheric temperature, humidity, etc.
- “Health on a continuum is the degree of client’s wellness that exists at any point of time, ranging from an optimal health condition, with available energy at its maximum to death, which represents total energy depletion.”

HEALTH CONTINUUM

Illness-Wellness Continuum

Types of Illnesses

- Illnesses are classified as either *acute* or *chronic*.
- A person may have an acute illness, a chronic illness, or both at the same time.

Types of Illnesses

- **Acute Illness**

- Acute illness usually has a rapid onset of symptoms and costs only for a relatively short time.
- Some acute illnesses are life-threatening, whereas some, like the common cold and diarrhea, do not usually require medical treatment and can be treated with self-treatment or the use of over-the-counter medications.
- When a person becomes acutely ill, certain illness behaviors may occur in identifiable stages
- . These behaviors are the way people cope with alterations in function caused by the disease. They are unique to the individual and are influenced by age, gender, family values, economic status, culture, educational level, and mental status

Types of Illnesses

- **Chronic Illness**
- Chronic illness usually has a slow onset, and many have periods of **remission** (when the disease is present, but the person does not experience symptoms) and **exacerbation** (the symptoms of the disease reappear).

Types of Illnesses

- Chronic illness has one or more of the following characteristics:
- It is a permanent change.
- It causes or is caused by irreversible alterations in normal anatomy and physiology.
- It requires special patient education for rehabilitation.
- It requires a long period of care or support.

FACTORS INFLUENCING HEALTH

- The factors that influence health are multifactorial, which are both within the individual and externally in the society in which he or she lives.
- The factors influencing health can be broadly classified into:
 - Genetic factors
 - Environmental factors

Genetic Factors/Heredity/Human Biology

- The mental and physical traits of every human being are determined by the nature of the genes to some extent.
- Several diseases are known to have a genetic origin, e.g., diabetes, hemophilia, etc.
- The state of health, therefore, depends partly on the genetic constitution of man.
- The steady state of the internal environment of the body is called homeostasis.

Environmental Factors

- The environment has a close relation to the health of an individual. It can be external or internal.
- The internal environment pertains to every component of the body, every tissue, organ, and organ system, and their hormones functioning within the system.
- The external environment of man is the aggregate of all external conditions that affect the development of the life of an individual. If the environment is favorable, he/she can make full use of the physical and mental capacities he/she has inherited.

Causes and Risk Factors for Developing Illness

- Risk factors can be modifiable and non-modifiable.
- Non-modifiable risk factors:
 - Genetic
 - Age
 - Biological characteristics
- Modifiable risk factors
 - Personal health habits
 - Lifestyle
 - Environment

Stages of illness behavior

Stage 1: Experiencing symptoms

- When a person becomes actually ill, certain illness behaviors may occur in identifiable stages. (Suchman, 1965).
- These behaviors are the way people cope with alterations in function caused by the disease.
- They are unique to every individual. If the symptoms last for a short time or are relieved by self-care, the person usually takes no further action.

Stages of illness behavior

Stage 2: Assuming the sick role

- If the symptoms persist, the person may choose to do nothing, may buy over-the-counter medications to relieve symptoms, or may seek out a healthcare provider for diagnosis and treatment.

Stages of illness behavior

Stage 3: Assuming a dependent role

- During this time, a person may be dependent on others and may seek assistance in carrying out activities of daily living.
- If the illness is serious, the patient may have to be hospitalized for treatment, or it can be managed at home.
- To facilitate adherence to the treatment plan, the patient needs effective relationships with caregivers, knowledge about the illness, and an individualized plan of care.
- The patient's responses to care depend on a variety of factors, including the seriousness of illness, the patient's degree of fear about the disease, loss of roles, the support of others, and personal experiences with illness care.

Stages of illness behavior

Stage 4: Achieving resources and rehabilitation

- Recovery and rehabilitation might begin in the hospital and conclude at home.
- Most patients complete this final stage of illness behavior at home.
- In this stage, the person gives up the dependent role and resumes normal activities and responsibilities.

DIMENSIONS OF HEALTH AND ILLNESS

- The factors that influence health and illness related to the person in terms of the human dimension are as follows:
- Each dimension interrelates with the others and influences the behavior of each person in health and illness.
- Each person is a composite of physical dimension, emotional dimension, environmental dimension, intellectual dimension, sociocultural dimension, and spiritual dimension, and each dimension influences the behavior of the person receiving care.

All of these interdependent parts compose the whole person.

Maslow's Hierarchy of Needs

- Maslow's Hierarchy of Needs is a psychological theory proposed by Abraham Maslow in 1943 that outlines a five-tier model of human needs, ranging from basic physiological needs to self-actualization.
- Certain needs are more basic or essential than others and must be at least minimally met before other needs are considered.
- Maslow arranged the hierarchy to show that certain needs are more basic than others into five levels

Maslow's Hierarchy of Needs

- In healthcare, particularly in nursing, understanding Maslow's Hierarchy of Needs is crucial for providing holistic care that addresses the physical and also the psychological and social needs of patients.
- This model serves as a framework for nursing practice and education, helping nurses prioritize patient care and create comprehensive care plans.
- In nursing, these needs can guide patient care by helping nurses assess and prioritize interventions based on the most immediate and critical requirements of their patients.

Maslow's Hierarchy of Needs

- Maslow's Hierarchy of Needs is typically represented as a pyramid, with the most fundamental needs at the base and higher-level needs at the top. The five levels are:
- **Physiological Needs:** Basic needs for survival, such as food, water, air, sleep, and shelter.
- **Safety Needs:** Protection from harm, danger, and fear; stability and security in one's environment.
- **Love and Belonging Needs:** Emotional needs for friendship, family, intimacy, and social connections.
- **Esteem Needs:** Needs for self-esteem, respect, recognition, and personal accomplishment.
- **Self-Actualization Needs:** The desire to achieve one's fullest potential, pursue personal growth, and engage in meaningful activities.

Maslow's Hierarchy of Needs

Importance of Maslow's Hierarchy of Needs in nursing education

- Understanding Maslow's Hierarchy of Needs is not only crucial for clinical practice but also a fundamental component of nursing education. It equips nursing students with a holistic approach to patient care, emphasizing the importance of addressing both physical and psychological needs.

Importance of Maslow's Hierarchy of Needs in nursing education

1. Holistic patient assessment

- Conducting a comprehensive assessments considers the entire spectrum of a patient's needs.
- This approach ensures that care plans are not just focused on medical conditions but also consider social, emotional, and psychological factors that affect health outcomes.

2. Prioritization and decision-making

- Maslow's hierarchy helps nurses understand how to prioritize patient care effectively.
- For example, in a scenario where a patient is experiencing both physical pain and anxiety, students learn to address the physiological need (pain management) first before focusing on the psychological need (anxiety relief).

3. Enhanced communication skills

- Applying Maslow's hierarchy encourages nurses to develop strong communication skills that foster trust and rapport.
- Understanding patients' needs at every level helps future nurses to communicate more effectively, providing information and emotional support tailored to each patient's specific situation.

Importance of Maslow's Hierarchy of Needs in nursing education

4. Empathy and compassion

- By learning about the different levels of human needs, one develops a greater sense of empathy and compassion. One learns to see beyond a patient's diagnosis and recognize the human being behind the condition, leading to more compassionate and person-centered care.

5. Patient empowerment and education

- Maslow's theory emphasizes the importance of self-actualization and empowerment.
- Thus learning the value of patient education and engagement, enabling patients to take an active role in their care, set realistic goals, and achieve a sense of control over their health journey.
- .

Importance of Maslow's Hierarchy of Needs in nursing education

- Maslow's Hierarchy of Needs is a valuable tool in nursing practice and education.
- It provides a framework for delivering holistic care that addresses the full range of patient needs—from the most basic physiological requirements to the pursuit of personal growth and fulfillment. For nursing education, it fosters a comprehensive approach to patient care, emphasizing the importance of empathy, communication, and prioritization.
- As healthcare continues to evolve, Maslow's hierarchy remains a timeless model that helps nurses deliver compassionate, effective, and patient-centered care.

PROFESSION

Bailliere's Nurses dictionary defines a **profession** as a 'calling, vocation requiring specialised knowledge, methods and skills, as well as preparation in an institution of higher learning in the scholarly, scientific and historical principles underlying such methods and skills'.

Profession

- The dictionary further states that members of a profession are committed to continuing study, to enlarging their body of knowledge, to placing service above personal gain and to providing practical services, vital to human society and social welfare.
- It adds that a profession functions autonomously and is committed to higher standards of achievement and conduct (Baillieres').

- ***The nursing profession is distinguished by its philosophy of care, full time commitment to human well being, particular blend of knowledge and skills, valuable service to the community and the regulation of its practice.***

A profession:

- 1. Has a theoretical body of knowledge and skills*
- 2. Encourages full time commitment to service, establishing standards of practice which are maintained by all members*
- 3. Exercises self-discipline*
- 4. Protects the public*
- 5. Is responsible for the advancement of the profession*
- 6. Develops its ethics to accommodate new demands and circumstances of the profession*

Professional Nurse

A professional nurse is an individual who has successfully undergone a prescribed nursing training programme, has passed a licensing examination and is registered by the national nursing regulatory body, in our context the Nursing Council of Kenya (NCK).

Characteristics of a Professional Nurse

A professional nurse:

- Displays high standards of performance and integrity in nursing practice
- Seeks constantly to improve her/his technical and interpersonal skills through continuing education and research
- Uses sound judgement and discretion in dealing with patients/clients and their relatives
- Provides holistic care to patients, family and community
- Deals competently with crisis situations
- Puts what is good for professional services to patients ahead of self-interest

- Coordinates and evaluates nursing services in cooperation with members of other health services (collaboration and networking)
- Is not overly concerned with the materialistic aspects of nursing
- Expects to find satisfaction and spiritual values in their work
- Feels responsible for the status of nursing and tries to advance and never to retard it
- Has inner resources to which she/he can turn to, for renewal of faith and courage when weary and discouraged
- Is proud of her/his profession and considers it to be at par with other professions like medicine or law or any other vocation practised for compensation, which at the same time contributes in its own unique way to the welfare of humanity

Personal Attributes

Personal attributes that help a nurse to display professionalism include:

- Good personal appearance with a voice that does not scare patients
- A ready smile, gentle hand, orderly in thought and action
- Emotionally mature, compassionate, dignified, tolerant, friendly, sympathetic and interested in other people

- All characteristics are advantageous to the creation of a friendly and conducive environment for the patient's recovery.
- As a nurse, you must at all times have **serenity** of mind and self-control to be able to handle a variety of situations and patients.
- ***Remember: A professional nurse at all times displays integrity, commitment and ethical behaviour. They display intelligence, good judgement and handle emergencies well.***

A professional nurse is also responsible in professional and social situations.

- **Personal Grooming**

- Personal grooming is very important to nurses. Remember, every patient has a mental picture or image of how their nurse should be. The nurse's appearance provides security and hope to a patient.
- A nurse's uniform should not be tight or very loose to hinder free movement during an emergency. It must be very clean to prevent cross infection and is to be well pressed. The dress or skirt should be below the knee cap to give allowance for bending. The material should not be 'see-through'.
- Nurses should avoid bright inner wear if their uniform is white. The uniform should be well maintained, that is, fallen buttons or torn zippers should be replaced, rips and tears mended and stains removed.

- Hair is a source of micro-organisms. Female nurses should tie back long hair neatly.
- Male nurses should have their beards and moustaches neatly shaven. The nurse's cap should be worn neatly and securely.
- Shoes should be low-heeled and soft to avoid making excessive noise, which may disturb patients. The nurse should maintain daily care of shoes, socks or stockings in order to prevent cross infection.
- Nails should be trimmed and coloured nail polish avoided. The freedom to wear jewellery, watches, pens, scissors or handkerchiefs will depend on individual hospital regulations
- **Remember: *The patients have a right to identify the nurse who is providing their care.***
- ***It is advisable therefore to wear an identification tag at all times showing full names and qualifications.***

Nursing Historical development

Historical development

- Caregivers for those who were ill or injured have always been a part of history.
- Most early civilizations believed that illness had supernatural causes.
- The physician was the medicine man who treated disease by chanting, inspiring fear, or opening the skull to release evil spirits (Dolan, Fitzpatrick, & Herrmann, 1983).
- The nurse usually was the mother who cared for her family during sickness by providing physical care and herbal remedies.

Early civilization to 16th Century

- As civilizations grew, temples became the centers of medical care.
- Priests were highly regarded as physicians, the nurse was viewed as a slave, carrying out menial tasks based on the orders of the priest—physician.
- In the early Christian period, nursing began to have a formal and more clearly defined role.
- In addition to having a poor reputation, nurses received low pay and worked long hours in unfavorable conditions.

Florence Nightingale and the Birth of Modern Nursing(1820-1910)

Florence Nightingale and the Birth of Modern Nursing

- From the middle of the 18th century to the 19th century, social reforms changed the roles of nurses.
- It was during this time that nursing as we now know it began, based on many of the beliefs of Florence Nightingale.
- The outbreak of the Crimean War and a request by the British to organize nursing care for a military hospital in Turkey gave Nightingale an opportunity for achievement (Kalisch & Kalisch, 2004).

Florence Nightingale's contributions

- After the war, she returned to England, established a training school for nurses and wrote books about healthcare and nursing education.
- Identifying the personal needs of the patient and the role of the nurse in meeting those needs.
- Establishing standards for hospital management.
- Establishing a respected occupation for women.
- Establishing nursing education.
- Recognizing the two components of nursing: health and illness.

Florence Nightingale's contributions

- Believing that nursing is separate and distinct from medicine
- Recognizing that nutrition is important to health.
- Instituting occupational and recreational therapy for sick people.
- Stressing the need for continuing education for nurses.
- Maintaining accurate records, recognized as the beginnings of nursing research.

Development of Nursing from the 19th to 21st Centuries

- Both the work of Florence Nightingale and the care provided for battle casualties during the Civil War focused attention on the need for educated nurses in the United States.
- Schools of nursing, founded in connection with hospitals, were established on the beliefs of Nightingale.
- The lack of educational standards, the male dominance in healthcare, and the pervading Victorian belief that women depended on men combined to contribute to several decades of slow progress toward professionalism in nursing (Kalisch & Kalisch, 2004).

Development of Nursing from the 19th to 21st Centuries

- World War II had an enormous effect on nursing.
- Women became more independent and assertive.
- These changes in women and in society led to an increased emphasis on education.
- The war created a need for more nurses and resulted in a knowledge explosion in medicine and technology, which broadened the role of nurses.

Development of Nursing from the 19th to 21st Centuries

- After World War II, efforts were directed at upgrading nursing education.
- Schools of nursing were based on educational objectives and were increasingly developed in university and college settings, leading to degrees in nursing for men, women, and minorities.
- Nursing has broadened in all areas, including practice in a wide variety of healthcare settings, the development of a specific body of knowledge, the conduct and publication of nursing research, and recognition of the role of nursing in promoting health.
- Increased emphasis on nursing knowledge as the base for evidence-based practice has led to the growth of nursing as a professional discipline.

Clara Barton, founder of the American Red Cross in 1882

Florence Nightingale, initiator of major reforms in healthcare and nursing training in England

Vassar training camp classroom, 1918

Isabel Hampton Robb, outstanding leader in nursing and nursing education

Mary Mahoney, America's first African American nurse to graduate from a school of nursing

Philadelphia General Hospital nurse, late 1800s

Post-WWII nursing school poster

Person	Contribution
19th Century	
Florence Nightingale	Defined nursing as both an art and a science, differentiated nursing from medicine, created free-standing nursing education; published books about nursing and healthcare; is regarded as the founder of modern nursing (see text for further information)
Clara Barton	Volunteered to care for wounds and feed Union soldiers during the Civil War; served as the supervisor of nurses for the Army of the James, organizing hospitals and nurses; established the Red Cross in the United States in 1882
Dorothea Dix	Served as superintendent of the Female Nurses of the Army during the Civil War; was given the authority and the responsibility for recruiting and equipping a corps of army nurses; was a pioneering crusader for the reform of the treatment of the mentally ill
Mary Ann Bickerdyke	Organized diet kitchens, laundries, and an ambulance service and supervised nursing staff during the Civil War
Louise Schuyler	A nurse during the Civil War; returned to New York and organized the New York Charities Aid Association to improve care of the sick in Bellevue Hospital; recommended standards for nursing education
Linda Richards	Graduated in 1873 from the New England Hospital for Women and Children in Boston, Massachusetts, as the first trained nurse in the United States; became the night superintendent of Bellevue Hospital in 1874 and began the practice of keeping records and writing orders
Jane Addams	Provided social services within a neighborhood setting; a leader for women's rights; recipient of the 1931 Nobel Peace prize
Lillian Wald	Established a neighborhood nursing service for the sick poor of the Lower East Side in New York City; the founder of public health nursing
Mary Elizabeth Mahoney	Graduated from the New England Hospital for Women and Children in 1879 as America's first African American nurse
Harriet Tubman	A nurse and an abolitionist; active in the underground railroad movement before joining the Union Army during the Civil War
Nora Gertrude Livingston	Established a training program for nurses at the Montreal General Hospital (the first 3-year program in North America)
Mary Agnes Snively	Director of the nursing school at Toronto General Hospital and one of the founders of the Canadian Nurses Association
Sojourner Truth	Provided nursing care to soldiers during the Civil War and worked for the women's movement
Isabel Hampton Robb	A leader in nursing and nursing education; organized the nursing school at Johns Hopkins Hospital; initiated policies that included limiting the number of hours in a day's work and wrote a textbook to help student learning; the first president of the Nurses Associated Alumnae of the United States and Canada (which later became the American Nurses Association)

20th Century

Mary Adelaide Nutting	Became the first professor of nursing in the world as a faculty member of Teachers' College, Columbia University; with Lavinia Dock, published the four-volume <i>History of Nursing</i>
Elizabeth Smellie	A member of the original Victorian Order of Nurses for Canada (a group who provided public health nursing); organized the Canadian Women's Army Corps during World War II
Lavinia Dock	A nursing leader and women's rights activist; instrumental in the Constitutional amendment giving women the right to vote
Mary Breckenridge	Established the Frontier Nursing Service and one of the first midwifery schools in the United States
Margaret Sanger	Founder of Planned Parenthood

Aims of Nursing

Four broad aims of nursing practice can be identified in the definitions of nursing:

1. To promote health
2. To prevent illness
3. To restore health
4. To facilitate coping with disability or death

Aims of Nursing

- To meet these aims, the nurse uses knowledge, skills, and critical thinking to give care.
- Nurses use four essential competencies:
cognitive, technical, interpersonal, and ethical/legal skills to provide safe and knowledgeable care.

Aims of nursing

- Cognitively skilled nurses think about the nature of things sufficiently to “make sense” of their world.
- Technically skilled nurses manipulate equipment skillfully to produce a desired outcome or result.
- Interpersonally skilled nurses establish and maintain caring relationships that facilitate the achievement of valued goals while simultaneously affirming the worth of those in the relationship.
- Ethically and legally skilled nurses conduct themselves in a manner consistent with their personal moral code and professional role responsibilities.

Trends and issues in Nursing

- Trends in nursing are **the patterns that have shaped the profession, guided legislation**, and given reason to the way that healthcare facilities operate today.
- An issue, by definition represents **an unsettled situation**, a circumstance that engenders debate about alternatives, a dispute or contests

Trends and issues influencing Nursing

- Rapid knowledge expansion; increasing use of technology and informatics in education and practice.
- Choosing the most effective electronic and technology options
 - Information overload; unlimited global resources, global research opportunities, issues
 - Identifying current and accurate information; material rapidly outdated
 - Expanded expectations, limited time, rapid response expected; little time for reflection
 - Expansion of nursing informatics, content and skills development

Trends and issues influencing Nursing

- Online Nursing education
- Telehealth visit - use of telecommunication technology to enable clinical health services delivered remotely.
- Nurse Navigator Positions - Nurse navigators have a dual role, providing nursing care and acting as case managers. They guide patients through the healthcare journey, from diagnosis and treatment to follow-up and beyond.
- Higher Education Degrees Becoming Standard.

Trends and issues influencing nursing

- Performance-based competency: learning and objective assessment methods.
- Multiple teaching-learning methods: interactive collaborative, in-class and out-of-class projects; problem-based learning; increasing self-responsibility; accountability for learning and competence; interprofessional learning; using electronic devices, media to access resources

Trends and issues influencing nursing

- Socio demographics, cultural, diversity, economic, and political changes, and global issues.
 - Increasing multicultural, ethnic diversity requires increased learning, respect for differences, preferences, customs; generational issues
 - Community, faith-based projects, service-learning projects
 - Global community, globalization health issues; global nursing networks
 - Social, economic, and political changes influence health care delivery and access to clinical experiences; influence disrespect, conflict, abuse, violence; increased poverty and need

Trends and issues influencing nursing

- Community-focused interdisciplinary approaches.
- Interprofessional collaborative learning
 - Diverse alternative health practices, influence of cultures
 - Broad scope of nursing; clinical approach; increasing use of diverse experiences throughout community; continuum from acute care to health promotion; from hospitals to home to rural to global settings
 - Requires more planning, travel time, expenses, arrangements; different skills, communications; critical thinking, problem-solving strategies

Trends and issues influencing nursing

- Increasing Demand for Elder Care
- Entrepreneur nurses
- Higher education attainment.

Issues in Nursing

- Staff shortage
- Meeting client expectations is difficult with the reduced number of nurses.
- Long Working Hours – Long hours and overtime aren't a new issue. Nurses are repeatedly expected to complete 12-hour shifts with additional overtime too.
- Workplace Violence - Violence towards nurses can range from a verbal attack to something a little more serious.

Issues in Nursing

- Workplace Hazards - regularly working with needles, sharp tools and heavy equipment.
- Personal Health - Working in healthcare is a stressful occupation and can cause stress-related health problems.

Public and private sector

- **Private sector** - those individuals and organizations providing health services or products that are not owned or directly controlled by government.
- **Public sector** – organizations providing health services that are owned and controlled by the government.

Arguments for public sector

- Healthcare is not a profit maximizing industry.
- Doctors and nurses don't need financial incentives to do a good job but are motivated by aims of patient care and job satisfaction.
- Healthcare doesn't work as a free market.
- Patients tend to trust diagnosis of the doctor.
- They don't go shopping around for best or cheapest health care.
- Trying to introduce competition in healthcare is fruitless because in practice patients are not in a position to shop around choosing between different doctors.

Arguments for public sector

- In healthcare, consumer sovereignty doesn't apply to other markets.
- Public healthcare provision means everyone has access to this important public service.
- Left to the free market, there would be some who don't have private healthcare insurance and would suffer.

Arguments for public sector

- Health care is a merit good. People may underestimate the importance of going to doctor for a check-up. This could lead to some diseases being left unchecked and becoming more serious and difficult to treat.
- Private healthcare and government subsidies for poor and elderly mean very high administration costs.
- Private healthcare insurance firms make large profit meaning more expensive health care for countries like the US, who have private provision

- The problem of adverse selection. The problem with the private provision is that people who are likely to be unhealthy will have greatest desire to purchase healthcare insurance. This raises insurance premiums. However, young healthy people will then be discouraged from buying relatively more expensive insurance; therefore many young people will not take out insurance – meaning insurers are left with a higher percentage of unhealthy people.
- When health care is paid for by private insurance. There is actually less mechanism for evaluating the cost/benefit of different treatments. Doctors are happy to prescribe expensive treatments, which may do little to help because the bill is paid for by insurance companies. In the public sector, there is a discipline of sticking within budgets and rationing health care to where it is needed most.

Arguments for private sector

- Gives people greater choice.
- Not limited by public budget which may limit access to expensive treatments. Private healthcare firms may have efficiency incentives to provide better service than government bodies.
- With an ageing population and increased range of treatments, demand for health care is rising faster than economic growth. A greater role for the private sector enables health care providers to keep up and reduce the burden on government spending – enabling lower tax rates.

- Reluctance to increase taxes to pay for healthcare. The National Health Services has the difficulty of rising demand, but limited willingness to increase taxes to pay for it. Increasing role of the private sector can fill the gap.
- Faster patient diagnosis and treatment.
- More personalized care as the patient to nurse ratio is met.
